WORLD-LEADING

INTEGRATED SOLUTION PROVIDER
OF BUILDING AND DECORATION MATERIALS.

Kareema, founded in 1997, has become China's leading and globally influential group company after more than 20 years of development. Kareema is committed to creating the world's top integrated building materials and home furnishing brand, and have

a big brand system including KAREEMA, SENNORWELL, BIRKIN, TAP&GO, BUILDMOST.

Over the years, Kareema has been committed to becoming a world leader in integrated products, services and solutions for building materials and home furnishing. Through R&D (research and development) and manufacturing, industrial chain integration, to meet the global consumers' demand for high-quality products and for the delicate living environment. And guarantee the customers' satisfaction and peace of mind

EXCELLENT INTEGRATED SERVICE

SAVE MONEY, SAVE TIME, SAVE LABOUR

● ONE-STOP PRODUCT SUPPLY

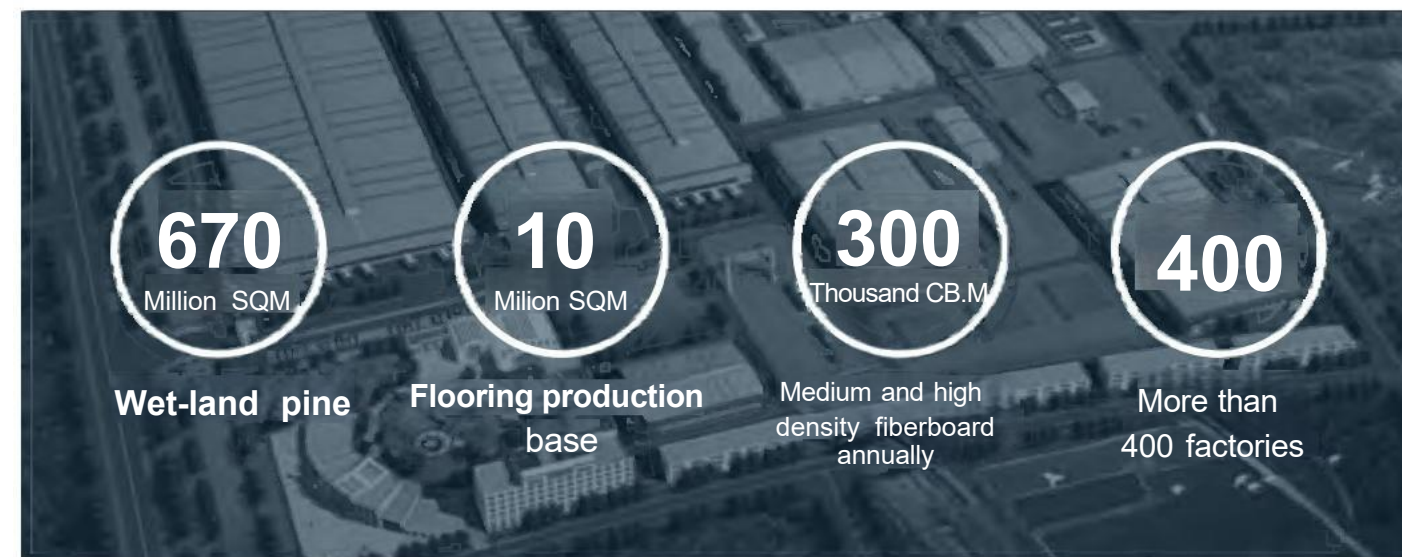

● ONE-STOP PROJECT SERVICE

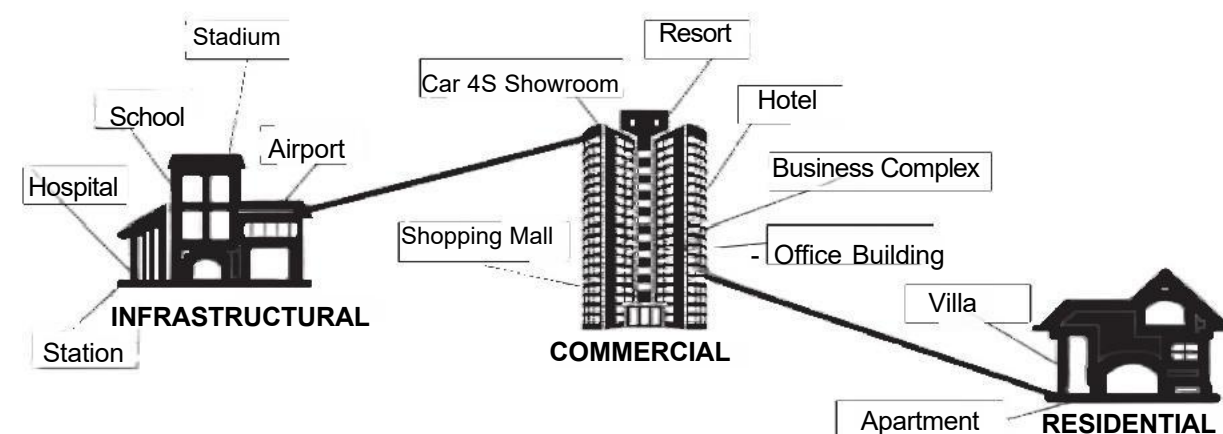

INTEGRATED INDUSTRIAL CHAIN

SELECTED GOOD MATERIALS, INGENIOUS MANUFACTURING,
EFFICIENT TECHNOLOGY, QUALITY ASSURANCE

70000+GLOBAL PROJECTS

INTEGRATION SOLUTIONS OF HOTELS, CURTAIN WALL PROJECT,
LUXURY APARTMENTS, AND VILLAS

WHOLE INDUSTRIES

WORLD-CLASS ECOSYSTEM OF CONSTRUCTION MATERIALS,
FURNITURE AND HOME FURNISHING

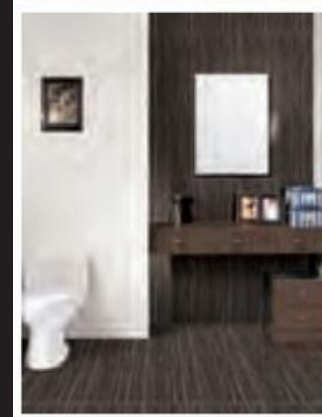

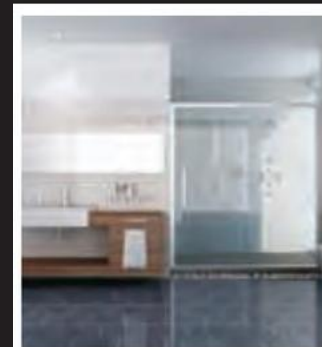

BuildMost Aonestop B2B internet platform which bridges supply, procurement and transactions for the whole industrial chain of global real estate, engineering, construction materials and design.

With an operation concept of focus, excellence and sharing, BuildMost is deeply dedicated to international construction materials, furniture and home furnishing.

With the appliance of internet, IoT, big data, cloud computing and other technologies, Buildmost aims to make it easy for buyers in the real estate, building materials, furniture and home furnishing field around the world to buy all kinds of cost-effective products and services, so that both buyers and sellers can easily realize their dream of requirement.

We will gradually develop into a professional building materials industry ecosystem which integrates B2B exhibition promotion, services of building materials international trade consulting, building materials international trade B2B matchmaking and architectural decoration design.

●Maintain and maintenance

- 1.Suds with a little of ammonia can make the ceramic tiles to be beautiful and bright
 - 2.Use rags with a little of linseed oil to rub up the cement on the ceramic tiles.
 - 3.Mix the equal linseed oil and pine-seed oil evenly,which is not only to rub up the smudge but also to keep the ceramic tile to be smooth and bright.
- Note:Dosing the wax oil:take 36g of wax oil inside the iron case upon the stove to boil;add 9g of coal oil and mix them to be wax oil-ike.The above amounts of wax oil can rub up about 1 square meter.If the acreage is larger,you can increase the dosage in terms of the above proportion.

●Operational Manual

- The product looks beautiful and bright.With low specific water absorption,strong counter bending,acid and alkali resistance, corrosion resistant,temperature resistance and freeze proof,it can be widely used in the decoration of the indoor walls and indoor floor.
- 1.Please pay attention to the size and color numbers marked on outside packing.Use the similar size and color numbers unless the same size and color numbers are run out.
 - 2.Please pay special attention to the designs about direction of the ceramics.Pave the product with the dark color versus dark color and light color versus light color so as to gain the optimum decoration effects.
 - 3.Please pave the products in one group consist of nine pieces on the spare space and examine all of the products before paving them.Please immediately contact the dealers or the after-sale service departments of our company if you find any obvious color difference.
 - 4.Please slurry the floor and walls with cement bonded sand before paving and chalk lines according to the brick size with 3-5mm of mortar joints reserved so as to prevent problems resulted from the different expanding rates between the dung and the brick.
 - 5.Before paving,suggest to blend the mixed stock consist of 325#neat cement group (or cement)and the cementing agent of glazed brick.And down the brick before paving.
 - 6.When paving the floor,you'd better float the scored wall and floor,and put two mutually perpendicular threads in certain height and adjust into horizontal level with level bar
 - 7 Take certain amounts of clay loam to the corner of the main wall and fatten it out as thick as about 1cm.Then take one brick to tile upon the clay loam.Use the wooden hammer to slightly strike until its cemented,and the brick facing,the brick edge and the thread are to be at horizontal and perpendicular positions.So do the other bricks in orders.
 - 8.After the clay loam is slightly dried,use wooden flour and silversand upon the brick facing to get rid of the remaining slurry.
 - 9.Knock and examine the brick facing after paving for 12 hours.Repaving if there are hollow sounds.Walk and wash only after paving all of the bricks for 24 hours.

●Preparation before construction:Decoration suggestions

- 1 Trail paste:trail paste before paving formal,the way of which is:pave the ceramic tile on the ground and examine from three meters away,make adjustments of the brick positions if there are any obvious color and size differences,contact with the local dealers if you are still not satisfactory after adjustments,we will provide satisfactory services for you.
- 2.Clear the basic bedding surface:clear the ground covered with oil stain with caustic soda,insulate some water to wet the ground.
- 3.Disposal of brick surfacing:To prevent pollution,rub up the ceramic tile surfacing before construction and clear the bottom of the brick with water for better pasting with cement.

Ceramic tile provides a beautiful, long lasting wall that's easy to take care of and is almost impossible to mark or stain. You can install wall tiles literally any place you want to be able to enjoy their beauty, but the obvious locations are in kitchens (as backsplashes or countertops) and in bathrooms and showers. Although most people think a ceramic wall is difficult to install, the reality is it's not beyond the range of a handy DIYer who is willing to spend some time understanding the process and take his time installing the wall.

Here's what you'll need:

Ceramic tiles	Cement board or green drywall	Galvanized cement board screws
Fiberglass tape	Level	Pencil
Tile adhesive	Notched trowel	Tile cutter (rented)
Tile nippers	Grout	Rubber float
Sponge	Utility knife	Silicon caulk
Buckets of clear water		

Some Ceramic Tile Info

You probably know that ceramic tile is available in lots of sizes, all the way from 1 square inch. Usually sold attached to sheets that are 12 inches by 12 inches—all the way up to 18 inches. They also come in a wide range of colors that can tie in with any decor. However, you probably didn't know that all ceramic tiles don't resist water. In fact, some ceramic tile, called non-vitreous, will actually absorb water, so it should only be used in areas where it won't come in contact with water. Semi vitreous and impervious ceramic tiles both resist water (impervious tiles won't absorb any water at all. So if you're looking to put your tiles on a bathroom or kitchen wall, be sure you get semi vitreous or impervious tiles.

Preparing the Wall

Ceramic tiles can be installed directly on drywall, plaster, or if they are in moist areas, onto "green" drywall or even better cement backer board. Green drywall is specifically designed for use in bathrooms. It's as easy (or as hard) to work with as ordinary drywall, but it's specially formulated to resist moisture. Its best use is in a kitchen or bathroom where the environment will get moist, but not where it will actually be exposed to water. Cement backer board is actually made from a fiberglass mesh and Portland cement so moisture won't bother it at all. It is available in 12 and 5/8-inch thick sheets similar to drywall, and is usually sold in 32 or 36-inch wide panels 5 or 8 feet long. Cement board is cut the same way as ordinary drywall—score it with a utility knife and then snap it at the line. It's installed by screwing it to the underlying studs; place the screws about 6 inches apart and use special galvanized screws that won't rust. The seams are finished by taping with special fiberglass seaming tape. Cement board is the best thing to use in a shower installation and even makes sense if you are installing a backsplash close to a sink.

Laying Out Your Tile Pattern

Find the center of your wall and use a carpenter's level to mark intersecting plumb (vertical) and level (horizontal) lines. Dry fit the first row of tiles starting at the center and working your way to the ends of the wall. You want the tiles at both row ends to be approximately the same size, so you may have to adjust your vertical reference line to make them match up. As the water absorption of the floor & wall tile is very high, if it's non water-proof tile, please put the tile in water for about half an hour.

Installing the Tile

Starting in the center, on one side of your reference line, apply a coat of tile setting adhesive to an area about 3' by 3' square. Take care not to cover your lines. Spread the adhesive with the smooth side of your notched trowel and then go over it with the notched side to create ridges in the adhesive. Firmly press each tile in place and give it a slight twisting motion to be sure it makes good contact with the adhesive. As you work your way along, place tile spacers on all four sides of each tile, so your grout lines will be consistent. Take your time and work on the wall in three square foot sections. At the end of a row or around fixtures, you'll probably need to cut some tiles. A rented ceramic tile cutter is the easiest way to make your straight cuts. Using this tool, score the cut line on a full tile and then snap the tile along the scribed line. Smooth the edge with 80 grit sandpaper (the edge of a cut ceramic tile is very sharp). Cutting irregular shaped tiles or around obstructions will require using "tile nippers." These are a heavy duty hand tool that you use to "nip" or bite off little pieces of a tile, one at a time, until you have cut the needed shape.

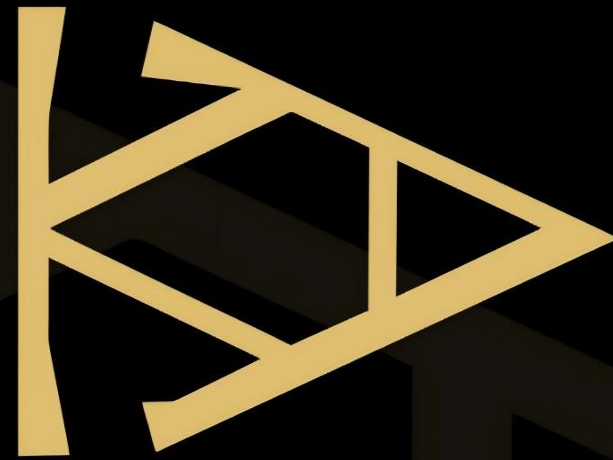

Grouting

After the tiles have all been installed and the adhesive has set up (probably overnight), it's time to grout the tiles. Depending on the width of your grout lines, you will need to choose either sanded or unsanded grout. If the spaces between the tiles are bigger than 1/8", use sanded grout. (Sanded grout actually contains sand particles that help make the grout joint stronger.) Remove all your tile spacers and mix the grout following manufacturer's directions (it should end up with a peanut butter-like consistency). If you're grouting in a bathroom or kitchen area, be sure your grout includes a waterproofing agent. Ask or read the manufacturer information to be sure you get the right grout. Using a rubber float, apply the grout at a 45-degree angle to the grout lines. Press firmly, you want to get grout all the way down to the bottom of the seams. Work in your 3' x 3' areas to be sure you get uniform coverage of all the grout lines. Wipe off any excess grout with a wet sponge and clear water. After the grout has had about 30 minutes to dry, go back over sections with a soft cloth and buff away any grout haze.

Finishing Touches

Let the grout dry for a day and again buff away any grout haze that has appeared. If your wall is in a kitchen or bathroom, use a mildew resistant silicone caulk to seal the edges of the ceramic tile section where it meets the counter or top of the tub.

Hint: A drop of liquid dishwashing soap on your finger will stop the caulk from sticking to your finger when you smooth the bed of caulk. It's also a good idea to apply a grout sealer after a week or so. This will prevent any dirt or stains from getting into the grout and ruining the appearance of your wall.
